

# Dimensionality Reduction and Feature Selection

Karimi Gichunge

11/13/2020

## 1. Defining the question

### Problem Statement

You are a Data analyst at Carrefour Kenya and are currently undertaking a project that will inform the marketing department on the most relevant marketing strategies that will result in the highest no. of sales (total price including tax)

## 2. Loading and checking data

```
#Loading dataset
sales <- read.csv("C:/Users/Karimi/Downloads/Sales.csv", stringsAsFactors = T)
head(sales)
```

```

```

From the summary, we can deduce the following from the data: 1. We have 1000 records and 16 attributes 2. Out of the 16 attributes, 8 are of data type character 3. We don't have any null values 4. Looking at the ranges around the summary statistics of our numeric variables, we see that they are measured in different units hence we will need to scale later

```
head(sales)
```

```

We don't have any abnormal entries. So we go ahead to drop the column for InvoiceID since it is only a unique ID for every transaction and will not be necessary for this analysis and the gross margin percentage since it is constant at 4.76 for all transactions.

```
#Dropping columns
sales <- subset(sales, select = -c(Invoice.ID,gross.margin.percentage))
```

```
head(sales)
```

```

#Distributions of different variables
par( mfrow= c ( 2 , 4 ))
for(i in 1 : length(nums)) {
  hist(nums[,i], main= names(nums[i]), xlab = names(nums[i]))
}
```

Our numerical variables don't

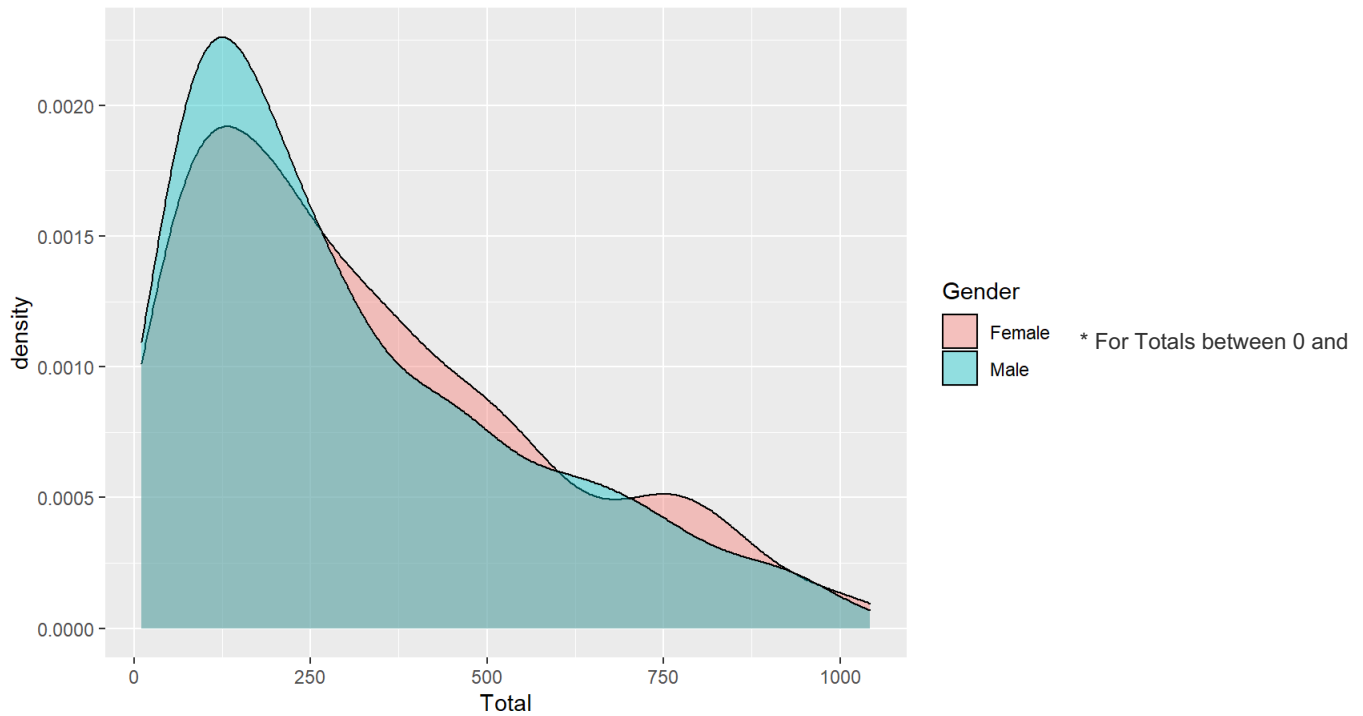

follow a normal distribution. \* Amount purchased per unit price seems to vary at all prices though a unit price of 90 to 100 has the highest number of customer entries \* Amount purchased seems to decrease with increase in Total and gross income, tax and cogs, with highest frequency levels being where variable values are least.

#### Checking how different factors affect our target variable "Total"

```
#Distribution of income per Gender
ggplot(sales,
  aes(x = Total,
    fill = Gender)) +
  geom_density(alpha = 0.4) +
  labs(title = "Distribution of total income per Gender")
```

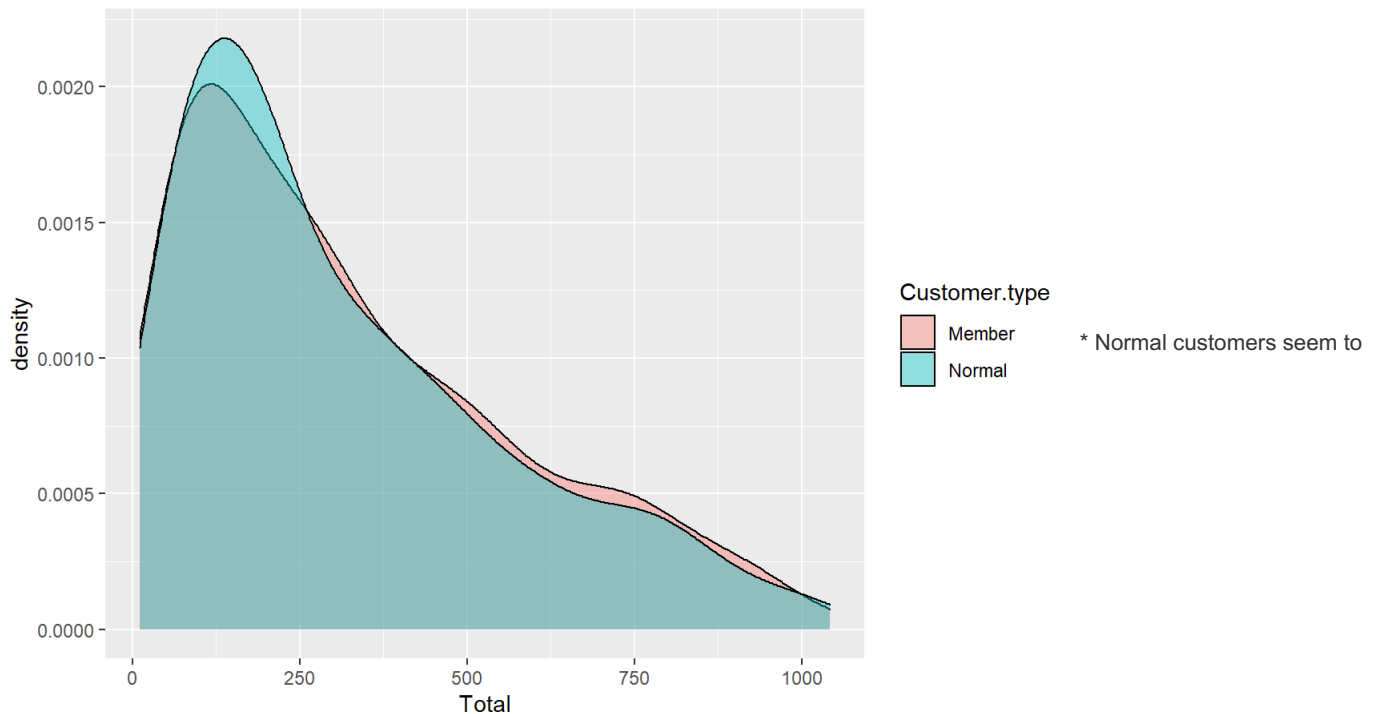

Distribution of total income per Gender

280 there seem to be more male than female though the frequency of females for totals exceeding 280 seems to surpass male

```
#Salary distribution by rank
ggplot(sales,
       aes(x = Total,
           fill = Customer.type)) +
  geom_density(alpha = 0.4) +
  labs(title = "Salary distribution by rank")
```

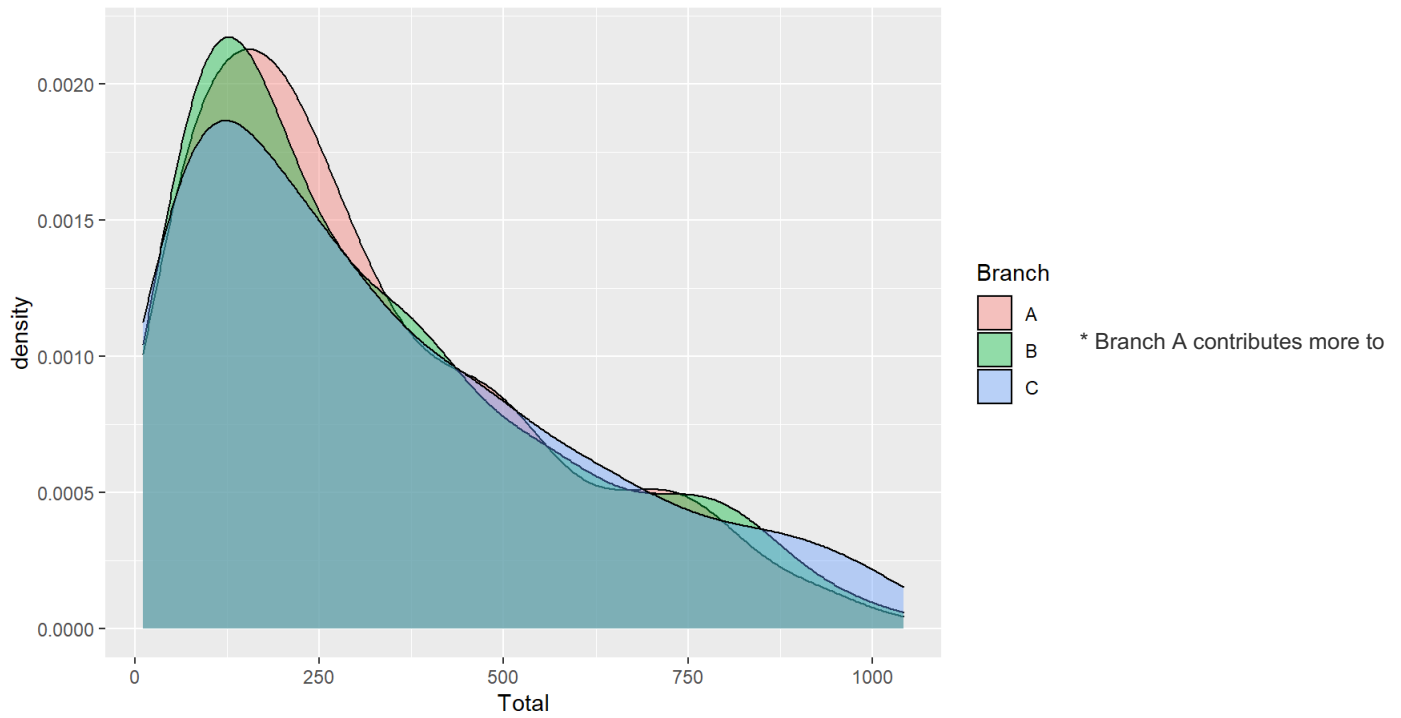

Salary distribution by rank

have a greater influence on total than members.

```
#Distribution of Total income per Branch
ggplot(sales,
       aes(x = Total,
           fill = Branch)) +
  geom_density(alpha = 0.4) +
  labs(title = "Distribution of Total income per Branch")
```

Distribution of Total income per Branch

Total and Branch C contributes the least

```
#Distribution of Total per Payment method
ggplot(sales,
  aes(x = Total,
    fill = Payment)) +
  geom_density(alpha = 0.4) +
  labs(title = "Distribution of Total income per Payment method")
```

Distribution of Total income per Payment method

```
#What quantity was mostly purchased in the store
ggplot(sales, aes(x = Quantity)) +
  geom_bar()
```

10 items, followed by those who purchased 1 item

```
library(corrplot)
```

```
## corrplot 0.84 loaded
```

```
#Get the correlation matrix
res = cor(nums)
#Plotting a correlation plot

corrplot(res, method="color", addCoef.col = "black",
          tl.col="black", tl.srt=45)
```

between Tax, Cogs and gross income. There is also high correlation between Unit Price and Tax, cogs and gross income and Total.

## 5. Dimensionality Reduction

# PCA

## Feature Engineering

All variables to be used for dimensionality reduction should be numerical variables, hence we will convert our factor categories to numerics. We will also drop the date and time columns.

```
#First we will make a copy of our sales dataset for future use
data <- sales
#Dropping columns for date and time
data <- subset(data, select = -c(Date, Time))
head(data)
```

```
##   Branch Customer.type Gender      Product.line Unit.price Quantity

```

We have obtained 11 principal components. Our first PC, PC1 explains 35.7% Variation, our second, PC2 explains 10.3%. The first 8 PCs gives us a variability proportion of upto 99%.

```
#Graph of variables
fviz_pca_var(data.pca,
  col.var = "contrib", # Color by contributions to the PC
  gradient.cols = c("#00AFBB", "#E7B800", "#FC4E07"),
  repel = TRUE        # Avoid text overlapping
)
```

contribute highly to the first PC whereas Gender, Payment mostly contribute to the second PC.

```
# Eigenvalues
eig.val <- get_eigenvalue(data.pca)
eig.val
```

```
##          eigenvalue variance.percent cumulative.variance.percent
## Dim.1  3.934732e+00      3.577029e+01             35.77029
## Dim.2  1.130132e+00      1.027393e+01             46.04423
## Dim.3  1.064187e+00      9.674426e+00             55.71865
## Dim.4  1.019927e+00      9.272061e+00             64.99071
## Dim.5  9.858334e-01      8.962122e+00             73.95283
## Dim.6  9.548085e-01      8.680077e+00             82.63291
## Dim.7  9.267825e-01      8.425296e+00             91.05821
## Dim.8  8.991345e-01      8.173950e+00             99.23216
## Dim.9  8.446266e-02      7.678424e-01            100.00000
## Dim.10 3.040817e-32      2.764379e-31            100.00000
## Dim.11 8.227863e-34      7.479875e-33            100.00000
```

Since the first 8 Principal Components contribute upto 99.23% of the variance proportion, they can be used for analysis.

## 6. Feature Selection

Using Filter Method Using the filter method, we will check for correlation between variables. We will then remove variables that are highly correlated as that is a sign of redundancy.

```
library(caret)
```

```
## Loading required package: lattice
```

```
#Separating target variable with independent variables
df <- data[-12]

# Calculating the correlation matrix
correlationMatrix <- cor(df)

# Find attributes that are highly correlated
highlyCorrelated <- findCorrelation(correlationMatrix, cutoff= 0.75)

# Highly correlated attributes

highlyCorrelated
```

```
## [1] 7 9
```

```
names(df[,highlyCorrelated])
```

```
## [1] "Tax" "cogs"
```

```
# Removing the highly correlated features
df.feats<-df[-highlyCorrelated]

# Performing a graphical comparison
par(mfrow = c(1, 2))
corrplot(correlationMatrix, order = "hclust")
corrplot(cor(df.feats), order = "hclust")
```

We can therefore conclude

that the following features will be used for analysis: \* Gender \* Payment \* Customer type \* Rating \* Branch \* Unit price \* Product line \* Quantity and \* Gross Income
